U. S. Department of Agriculture

*We have chosen this*  
**DISTINCTIVE  
NEW EMBLEM**

in which the G stands out, in order that our friends throughout the United States and Canada may more easily identify genuine Funk's G-Hybrids.

The G, of course, is more than a mark of identification. The G is a guarantee of proved ability to produce top yields of quality corn. The G denotes bred-in capacity to make Balanced 5-Star Performance. The G is a symbol of highest seed quality—based on highest production and processing standards that are faithfully maintained.

The producers of Funk's G-Hybrids are an association of experienced seedsmen whose reputation has been built up by many years of constructive, friendly service to farmers. The new Funk's G-Hybrid emblem—as was the familiar old Funk's G-Hybrid seal—is our guarantee to you of continued determination to maintain leadership in hybrid corn research, testing, production, distribution and service.

Here's Your New  
**CORN DATA NOTEBOOK**

Presented with the compliments  
of Your

**FUNK'S G-HYBRID DEALER**

# THE G STILL STANDS FOR GOOD

Farmers all over America have been planting Funk's G-Hybrids for many years. This season—as in many years past—more Funk's G-Hybrid seed than ever before will go into the ground—from Canada to Louisiana and from Colorado to Virginia.

All through the years, every hybrid developed and proved by Funk's Nationwide Research has been given a "G-Number." This year (as in the past) about 80 different G-Hybrids are being produced to meet the needs of every farmer wherever corn is grown. Each year, new and better G-Hybrids are made available to replace G-Hybrids which once were tops in their maturity class. At the same time, established G-Hybrids are being continually improved.

As a result, the Funk's G-Hybrids for any year represent the best that our many years of research can produce. Funk's G-Hybrids are made better every year. While we know this is true—because of the most extensive testing and proving program in the hybrid industry—we are content to say, as we have always said:

## FUNK'S G-HYBRIDS

are

*Consistently Good*

YEAR AFTER YEAR

# Number and Length of Rows in an Acre

This table will give you a fairly accurate and fast way to determine the number of acres of corn in a field or portion of a field by figuring the length of the rows and the distance between rows. For instance, if the rows are 40 inches apart and 160 rods long, then 4.9 rows make an acre.

Length of Row	Number of Rows to Make One Acre if Distance Between Rows Is:			
	36 in.	38 in.	40 in.	42 in.
40 Rods	22.2	20.8	19.8	18.8
50 Rods	17.6	16.6	15.8	15.0
60 Rods	14.7	13.9	13.2	12.5
70 Rods	12.6	11.9	11.3	10.7
80 Rods	11.1	10.4	9.9	9.4
90 Rods	9.8	9.3	8.8	8.3
100 Rods	8.8	8.3	7.9	7.5
110 Rods	8.1	7.6	7.1	6.8
120 Rods	7.3	6.9	6.5	6.2
130 Rods	6.6	6.4	6.0	5.8
140 Rods	6.2	5.9	5.6	5.3
150 Rods	5.8	5.5	5.3	5.0
160 Rods	5.5	5.2	4.9	4.7

# Corn Plants Per Acre at Various Planting Rates

Number of plants per acre affects yield. Too few plants on given fertility cuts yield below the maximum. Too many plants may result in spindly stalks, no ear or a very small ear. Fertility and available moisture should determine spacing. These tables show approximate number of corn plants per acre at various planting rates.

### Drilled Corn

Distance Between Rows	Spacing in Drill Row		
	10 Inches	14 Inches	
3 Feet	17,420	12,450	9,680
3 Ft. 2 In.	16,510	11,790	9,170
3 Ft. 4 In.	15,680	11,200	8,710
3 Ft. 6 In.	14,930	10,670	8,300

## Hill Dropped 2 per Hill

Distance Between Rows	Spacing Between Hills		
	20 Inches	24 Inches	
3 Feet	17,420	14,520	12,450
3 Ft. 2 In.	16,510	13,760	11,790
3 Ft. 4 In.	15,680	13,070	11,200
3 Ft. 6 In.	14,930	12,450	10,670

## Checked Corn

Distance Between Rows	Per Hill		
	2 Per Hill	3 Per Hill	4 Per Hill
3 Feet	9,680	14,520	19,360
3 Ft. 2 In.	8,690	13,030	17,380
3 Ft. 4 In.	7,840	11,760	15,680
3 Ft. 6 In.	7,110	10,670	14,220

# How to Compute Yields of Corn in the Field

## Hill Planted Corn

Pick and weigh all corn from 25 consecutive hills in four representative locations. Multiply the weight of corn from these 100 hills by the correct factor in table below. Result is yield in bushels per acre, on 70-lb. per bu. basis, uncorrected for moisture and shelling percentage.

Hill and Row Spacing	3'	3' 2"	3' 4"	3' 6"
3 ft.	.69	.65	.62	.59
3 ft. 2 in.	.65	.62	.59	.56
3 ft. 4 in.	.62	.59	.56	.53
3 ft. 6 in.	.59	.56	.53	.51

## Drilled Corn

Take the weight of corn husked from the distance shown in the table below. Multiply by 100 and divide by 70. The result is yield in bushels per acre, 70-lb. basis (uncorrected for moisture, shelling pct.).

Row Spacing	Distance to Pick
3 ft., 6 in.	124 ft.
3 ft., 4 in.	131 ft.
3 ft., 2 in.	137 ft.
3 ft.	142 ft.

## G-Hybrids'

# How to Correct Yields for Moisture Content

At the same time you weigh your crop, shell a 2-pound sample and seal in a fruit jar or glassine bag. Take it to your elevator to have moisture test made. After determining the actual moisture in sample, refer to table below. If corn is below 15.5 percent moisture add weight in the amount of the percentage

indicated. If corn is above 15.5 percent moisture subtract an amount equal to the percentage indicated opposite the moisture in corn. For example: 100 bushels of corn with 10.5 percent moisture is equal to 105.9 bushels of 15.5 percent moisture corn or 100 bushels plus 5.9 percent.

## Percentage of Shelled Corn Amount to Add or Subtract to Correct to 15.5 Percent Moisture Content

Pct. Moisture in Corn	Pct. to Add	Pct. Moisture in Corn	Pct. to Subtract	Pct. Moisture in Corn	Pct. to Subtract
10.5	5.9	15.5	0.0	20.5	5.9
11.0	5.3	16.0	0.6	21.0	6.5
11.5	4.7	16.5	1.2	22.0	7.7
12.0	4.1	17.0	1.8	23.0	8.9
12.5	3.6	17.5	2.4	24.0	10.1
13.0	3.0	18.0	3.0	25.5	11.8
13.5	2.4	18.5	3.6	30.5	17.8
14.0	1.8	19.0	4.1	35.5	23.7
14.5	1.2	19.5	4.7	40.5	29.6
15.0	0.6	20.0	5.3	50.5	41.4

# HOW TO CORRECT EAR CORN YIELD FOR SHELLING PERCENTAGE

To determine the number of bushels of shelled corn represented by a given number of bushels of ear corn, use the following method: Shell 20 pounds of ear corn and weigh the shelled corn. With this weight of shelled corn refer to the table below. The percentage figure opposite the weight of shelled sample is then multiplied by the number of bushels of ear corn. This will give the number of bushels to be

subtracted from or added to the original ear corn bushelage. For example: 100 bushels of ear corn at 70 pounds which gives 14 pounds of shelled corn from a 20-pound ear sample indicates that 12.5 percent is to be deducted. On the basis of 100 bushels, this would mean that you actually had only 87.5 bushels of shelled corn.

Weight of Shelled Sample	Percent to Subtract	Weight of Shelled Sample	Percent to Subtract	Weight of Shelled Sample	Percent to Add	Weight of Shelled Sample	Percent to Add
14.0	12.5	15.0	6.2	16.0	0.0	17.0	6.3
14.1	11.9	15.1	5.6	16.1	0.6	17.1	6.9
14.2	11.2	15.2	5.0	16.2	1.2	17.2	7.5
14.3	10.5	15.3	4.4	16.3	1.9	17.3	8.1
14.4	10.0	15.4	3.7	16.4	2.5	17.4	8.7
14.5	9.4	15.5	3.1	16.5	3.1	17.5	9.4
14.6	8.7	15.6	2.5	16.6	3.7	17.6	10.0
14.7	8.1	15.7	1.9	16.7	4.4	17.7	10.5
14.8	7.5	15.8	1.2	16.8	5.0	17.8	11.2
14.9	6.9	15.9	0.6	16.9	5.6	17.9	11.9

# Computing Capacity of Cribs

The following formulas give bushels of 70 lb. basis husked ear corn. For shelled corn, double number of bushels of ear corn and correct for moisture. For unhusked ear corn (72 lbs. per bu.), take  $\frac{2}{3}$  of figure for husked ear corn; unhusked corn varies greatly.

**Square or Rectangular Cribs** — Multiply the length by the width by the depth of grain (all in feet). Multiply this sum by 2 and divide by 5. The result is bushels of husked ear corn at 70 lbs. per bu. Correct for shelling percentage and moisture as directed on preceding pages.

**Round Cribs** — Multiply the diameter (distance across center) by the diameter. Multiply this sum by the depth (all in feet). Multiply the sum by .315. The result is bushels at 70 lbs. per bu. Correct for moisture and shelling percentages.

**Piles of Corn** — When heaped in form of a cone: Square the depth and square the inches of slant height (i. e. multiply each by itself). Subtract the lesser of these amounts from the greater. Multiply the difference obtained by the depth in inches. Multiply this product by .0024. The result is bushels of husked ear corn at 70 lbs. per bu. Correct for moisture and shelling percentage. When corn is heaped against a straight wall divide this result by two.

# CAPACITY OF SILOS

Depth of Silage Feet	Diameter Silo in Feet					
	10	12	14	16	18	20

45	71.29	102.53	139.74	182.24	230.64	277.44

Capacities are in tons after one month or more settling. In figuring acreage to fill silo use depth after settling rather than full depth of silo. For G-Hybrids used for silage one region North of maturity zone and ensiled in dough stage add 10% to capacity given; when unusually dry deduct 10%. Add 10% for G-Hybrids ensiled at same maturity as open-pollinated to allow for extra weight of grain.

**8 Funk's G-Hybrids—Fine for Silage**

# Bushel Weights of Common Commodities (In Pounds)

(Approximate; may vary by states)

## GRAINS

Corn (shelled)	56

## Weights of Other Common Units

Cotton: Bale (compressed to 15 lbs. per sq. ft., 54x46x27 in.)—480 lbs.

Hay: Bale—for market, the standard weight is 125 lbs. but bales are accepted down to 85 lbs.

Milk: One gallon weighs 8.6 lbs; 46½ qts. make 100 lbs. Cream, 1 gal. weighs 8.4 lbs.

Gasoline: One barrel (55 gals.) weighs 363 lbs.

**G-Hybrids "Weigh Heavy"**

**10 Plant the Best . . . Plant Funk's G**

# U.S.D.A. Grade Requirements for Shelled Yellow, White or Mixed Corn

Grade No.	Minimum test weight per bushel	Maximum limits of			
		Moisture	Cracked corn and foreign material	Total damaged kernels	Heat damaged kernels
1	54 lb.	14.0%	2%	3%	.1%
2	53 lb.	15.5%	3%	5%	.2%
3	51 lb.	17.5%	4%	7%	.5%
4	48 lb.	20.0%	5%	10%	1.0%
5	44 lb.	23.0%	7%	15%	3.0%

Sample grade shall include corn of the class Yellow Corn or White Corn, or Mixed Corn, which does not come within the requirements of any of the grades from No. 1 to No. 5, inclusive; or which contains stones and/or cinders; or which is musty, or sour, or heating, or hot; or which has any commercially objectionable foreign odor; or which is otherwise of distinctly low quality.

# PLANT NUTRIENTS RE- QUIRED BY THE CORN CROP

For continued big crops of corn, we must replace at least part of the plant nutrients removed by the crop. Fertility reserves in the soil are slowly being liberated and can supply part of the needs of the growing crop, but some replacements are needed to maintain good soils in a high state of fertility. The following table emphasizes our tremendous assignment in maintaining fertility balances. Amounts of nitrogen, phosphorus (phosphoric acid  $P_2O_5$ ) and potassium (potash  $K_2O$ ) needed by the crop have been calculated from many analyses.

## Requirements to Produce a 100 Bushel Corn Crop

CROP UNITS	Pounds Required		
	Nitrogen	Phosphoric Acid $P_2O_5$	Potash $K_2O$
100 bu. grain	95	38	25
3 tons stover	57	18	82
<b>TOTAL</b>	<b>152</b>	<b>56</b>	<b>107</b>

# POUNDS OF PLANT FOODS REMOVED FROM SOIL BY CROPS

CROP	Acres Yield	Nitrogen (N)	Phosphoric Acid (P <sub>2</sub> O <sub>5</sub> )	Potash (K <sub>2</sub> O)
<b>GRAIN CROPS</b>

# THE RIGHT HYBRIDS FOR YOUR FARM...

## You'll Find Them in This List

Funk's G-Hybrids are bred to meet specific needs of corn farmers for every neighborhood throughout the United States and Canada. The G-Hybrids listed here have been tested and proved outstanding, area by area under a complete range of soil, maturity, climatic, insect and disease conditions. Depend on your Dealer for help in choosing the BEST G-HYBRIDS for your needs and conditions. On this page, G-Hybrids are listed in approximate order of maturity, earliest first:

G-40	G-41	G-26	G-65A	G-244	G-98	G-711A
G-25	G-4	G-12	G-65	G-95A	G-90	G-716
